

task 4a answer:

- NNDR: 5/5 correct matchings
- Nearest neighbor distance: (2 / 5) correct matchings

→ NNDR has significantly higher accuracy compared to when ordering is based on Nearest neighbor distance.

task 4b answer:

Benefits of using SURF region:

- SURF is faster and can match in a constant time despite how large the size of the feature is.
- SURF is less affected by blur and noise because it uses box filters.
- SURF uses scale space so it can detect and match similarities even when the feature is close to or far away from the camera.

Harris is better than SURF when:

- Harris detects corner pixels and matches them so it's more precise when it comes to exact pixel coordinates. SURF searches for regions so it's not as precise.
